Notes:

- This module has an internal flash memory and a function to erase/sort unnecessary data if certain HCI commands are issued and consume more than a certain level of free space in the flash memory. This operation occurs at every module initialization (power-on).
If supply voltage becomes non-defined states during initialization or writing in flash memory, data in flashmemory might be destroyed. If the data in flash memory is destroyed, module will not work correctly. Therefore please be sure to stabilize power source before RESET release.
In addition please design module peripheral circuits to avoid temporary blackout of power source during operation. Please refer HD-AE-C 051089 for HCI command which rewrites flash memory data.
- Input /RESET signal of 10ms and more in condition of VDD_3.3V at over 3.0V.
- When the module is ready to accept the command, its module outputs the "04 0F 04 00 01 00 00" (Hex) to the UART TX Data Line. After that, please access to the module.
- Some of User Settings are stored in flash memory writable memory area and flash memory free space is controlled by Firmware. When the free space in flash memory is lower than certain amount, Defrag automatically starts. Amount of time required for Defrag will vary depending on the environment. Please conduct enough verification for the time required for the customer's product under customer's environment before use.
- The Typ. is a reference value. The value may change depending on the firmware version, conditions of use and types of flash memory.
- Internal RESET composes of the circuit shown below. /RESET signal must be driven by open drain. Please in put low voltage or open (1M ohm and over).

Notes:

- a) Up to seven connections: a slave of up to two masters, and/or a master of up to seven slave.
Some operations restricted or non-functional in a scatternet.
- b) Chip resource limits constrain the rate at which ACL and SCO connections can be made and broken to approximately
20 per 15 seconds. The time limit can be configured.
- c) Up to three SCO links. Each SCO link can be routed over the chip's PCM interface or over HCI/BCSP.
Preliminary Support for SCO over USB or H4 is in place, but testing has been light.
- d) No HCI SCO Host Controller to Host flow control support.
No HCI SCO Host to Host Controller flow control support.
- e) Limited support for "best effort" and "guaranteed" Qos only.
- f) Initial device name taken from PS Keys, and so is maintained through a reset/reboot.
- g) HCI Reset does not work if the device is in local loopback mode.
- h) Optional Paging schemes not supported.
- i) Remote ACL loopback sometimes deadlocks when the device's flow control mechanisms assert to each other.
- j) Bluetooth v1.1 specification command, deprecated in the v1.2 specification; support retained for backwards compatibility.
- k) Bluetooth v1.1 specification command, renamed in the v1.2 specification.

- l) Command not in the Bluetooth v1.1 specification.
- m) Underlying Flow_Specification functionality the same as for QoS_Setup.
- n) Command which rewrites FROM in module
- o) CVSD not available with 3EV3 or 3EV5 EDR packets.
- p) HCI Setup Synchronous Connection command does not support HV1,HV2 and HV3 Packet Type. If you want to use those Packet Types,please use HCI Add SCO connection command.

Recommendation for Module Mounting

Unit : mm

Notes:

- a. We recommend cutting motherboard, on which Taiyo Yuden module will be mounted, as described in the followings in order to ensure antenna characteristics.
- b. In addition we recommend keeping a case away from module antenna area and making the case with materials other than metal.

Notes:

1. Pin1 (VDD_3.3V) is used for power supply of BT module. (MAX 200mA).
To fill the standard of "Supply voltage ripple and spike noise", the capacitor ,which has the capacity of 2.2uF or more , should be put in the terminal VDD_3.3V outside as a bypass capacitor .
2. Strength pull-downs (pull-ups) are equivalent to a few kOhms resistance, but are more accurately modeled as a 40 uA current drain (source)
3. Weak pull-ups can be thought of 1M Ohm connections to VDD, but are more accurately modeled as a -1 uA current source.
4. PCM interface will be supported in the future.
